Geography in the Fall for all

Thinking of taking a course in Geography, but haven’t taken one before? Any of these can be taken as your first course in Geography:

**Geographies of Global Change** (1050) provides perspectives on the major geographical challenges and changes facing us, including climate and environmental change, sustainability, human development, economic globalization, cultural change, and population and migration.

**Cultural Geography** (2001) emphasizes the relationship between nature and culture: imperialism and colonialism; place, identity, and power; and global cultures of commodities, media, and tourism.

**Physical Geography: the Global Perspective** (2102) is a study of form, process, and change in natural systems at and near the surface of Earth, viewed as human environment. Emphasis is on global and regional scales in the investigation of climate, water, landforms and vegetation.

**Introduction to Geographic Information Sciences** (2195) involves cartography, remote sensing, and geographic information systems (GIS). We look at Geographic information through collection, representation and analysis methods, emphasizing maps and satellite images.

**Issues in Economic Geography** (2302) covers basic issues and ideas in economic geography. The development of a regional economy is related to underlying economic, cultural and physical factors.

**Natural Resources** (2425) is an introduction to the concepts of natural resources, environment and conservation: the nature and distribution of natural resources; and the various physical, social, economic, political, and technological factors influencing decision-making.

**Globalisation of Food** (3907) examines the production and consumption of food at global and local scales. Recent alternatives to the industrialisation and globalisation of food are explored through local food initiatives, fair trade and organic food.
