

## Blue Box Seminar Series

Department of Geography

PRESENTS:

*“Marine conservation in the Galapagos of XXI Century: facing challenges Charles Darwin did not encounter”*

### *Synopsis*

*Along the last 35 years, marine conservation in Galapagos has followed different patterns and formats, based on the varied values and principles sustaining the goal of marine protection.*

*The islands currently face different levels of threats, and the diverse stressors are influencing changes at different pace and scales. Illustrations of these marine conservation schemes will allow a better understanding of how the marine conservation aims have, or not, been achieved in the so called “paradise”.*
