

**Brit Kolditz** (MA Leipzig, Germany) is currently an Interdisciplinary Ph.D. student interested in research linking humanities and natural sciences. While a philosophical perspective searches for interconnections in asking big picture questions it also investigates most basic, intimate, co-affective, and thus ecological human conditions implying the possibility of relationality itself. The human-body-mind system is explored in its relationships to the fundamentally changing environments compared with the ancestral environments of the Holocene. Here, her research focuses on complementary knowledge about “nature” and its change provided by the living human body (e.g., concepts such as “bio-diversity-[loss]”; “One-Health”) and critically asks how to fundament and/or orient human actions in a transformative and sustainable way.

Additional concerns are currently natural rhythms and anthropogenic patterns of change, as well as light and sound and their trend to pollute.

**Areas of focus:**

- \* *New* phenomenology
- \* Transition and Transformation Research
- \* Philosophy of nature
- \* Ecology
- \* Eco-psychology
- \* Aesthetics
